

Comparing Limits of Functions: Squeeze Theorem

by Sophia

WHAT'S COVERED

In this lesson, you will evaluate more difficult limits by comparing them to other known limits. Specifically, this lesson will cover:

1. Defining the Squeeze Theorem
2. Evaluating Limits by Using the Squeeze Theorem

1. Defining the Squeeze Theorem

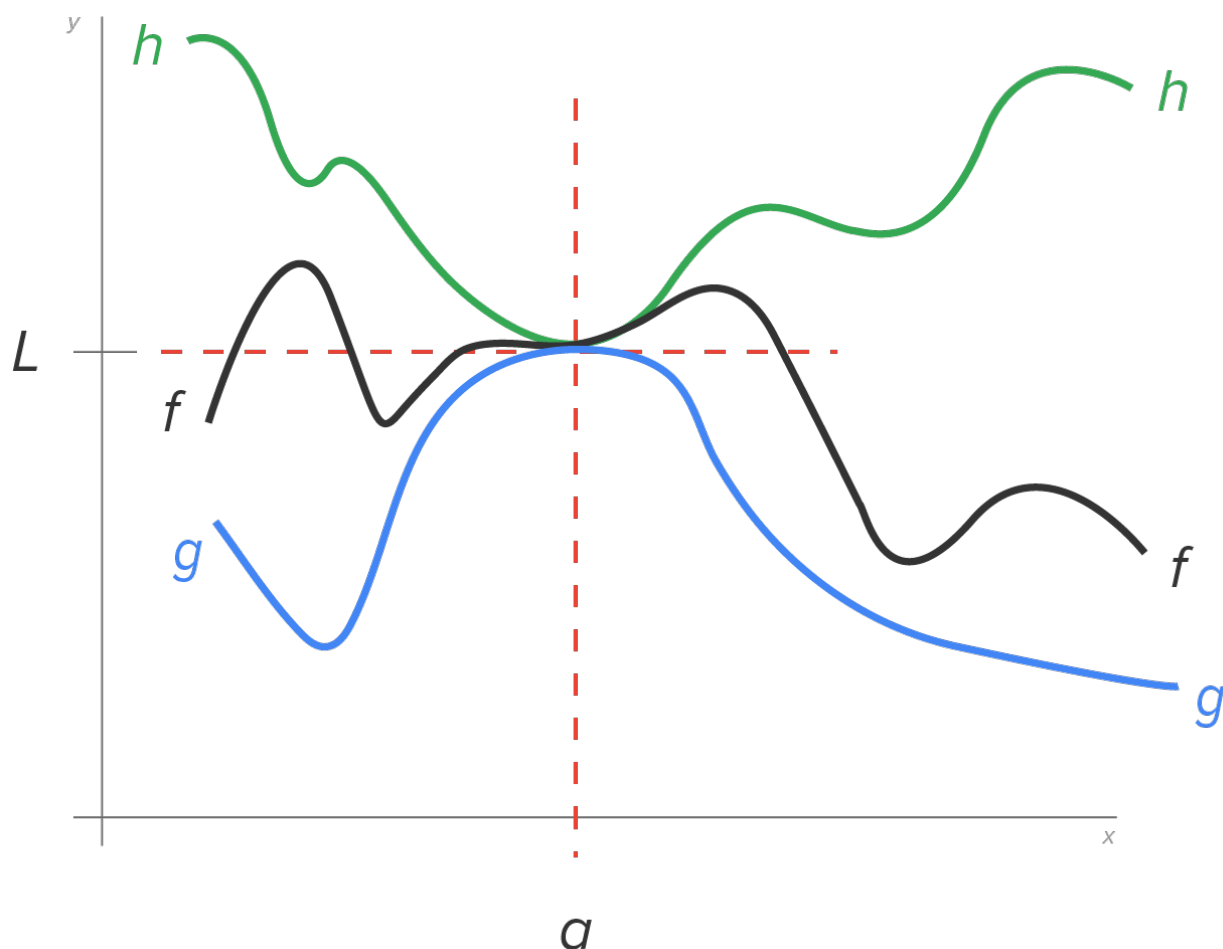

The squeeze theorem is a theorem that uses limit values and states the following:

CONCEPT TO KNOW

Suppose that $g(x) \leq f(x) \leq h(x)$ for all values of x near $x = a$, as shown in the figure below.

If $\lim_{x \rightarrow a} g(x) = \lim_{x \rightarrow a} h(x) = L$, then $\lim_{x \rightarrow a} f(x) = L$.

2. Evaluating Limits by Using the Squeeze Theorem

You can evaluate limits by using the squeeze theorem.

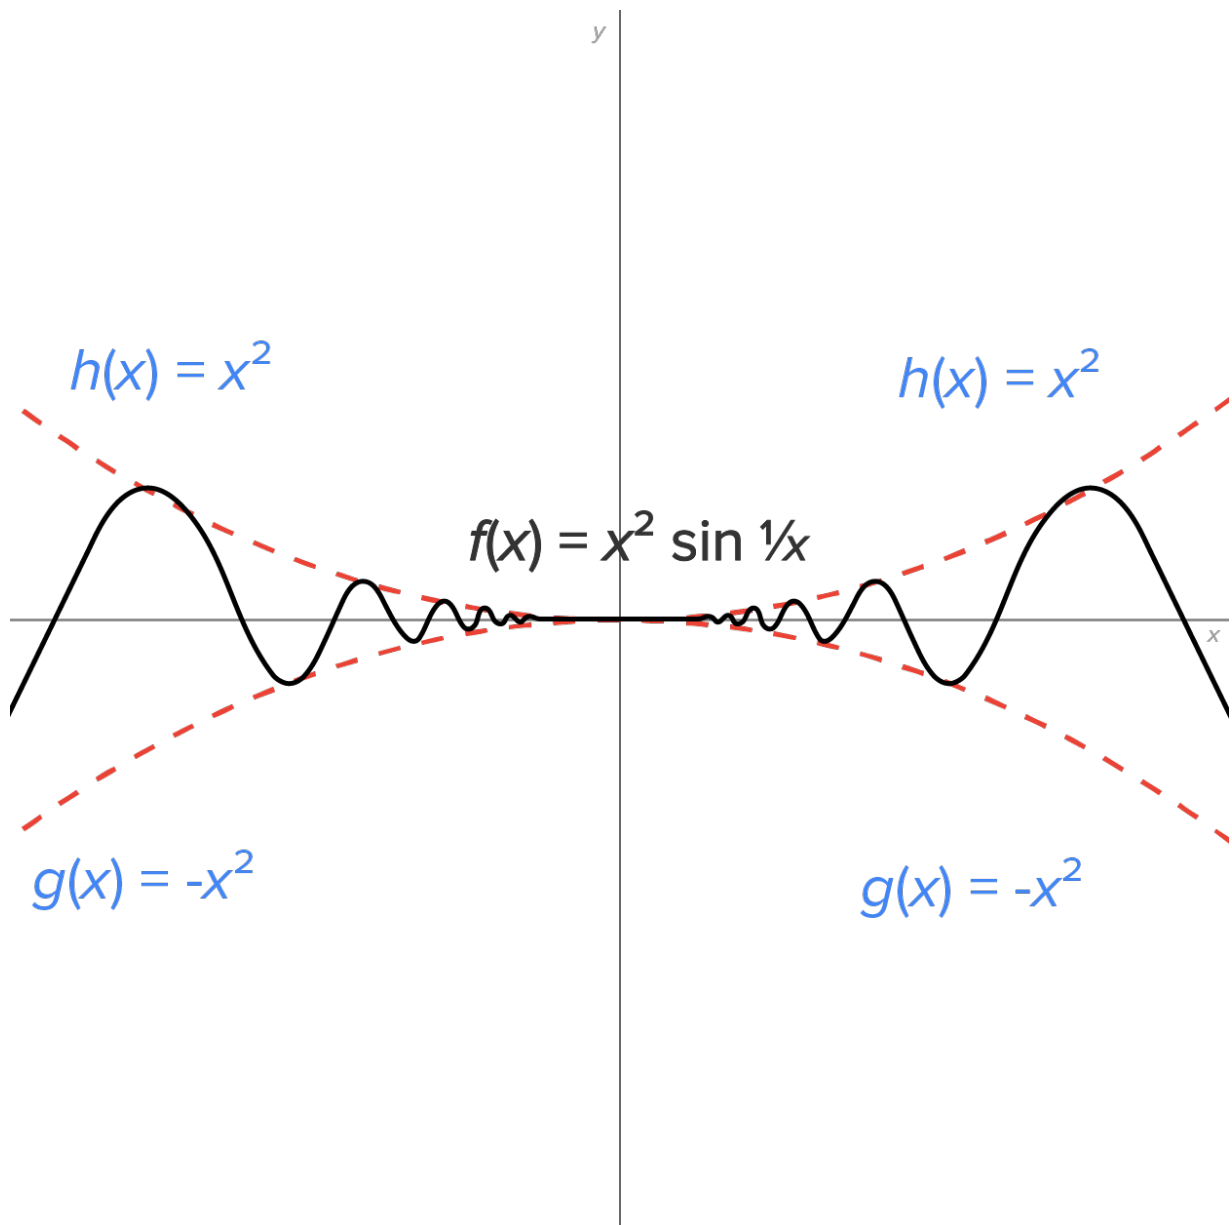

➡ **EXAMPLE** Consider the limit $\lim_{x \rightarrow 0} x^2 \sin\left(\frac{1}{x}\right)$. Note that direct substitution does not work since the function is undefined when $x = 0$.

Recall that the range of the sine function is $[-1, 1]$. This means for any choice of angle θ , $-1 \leq \sin \theta \leq 1$. This also means that $-1 \leq \sin\left(\frac{1}{x}\right) \leq 1$ $x \neq 0$.

Now, multiply all three parts of the inequality by x^2 . Since $x^2 > 0$, the direction of the inequalities is preserved: $-x^2 \leq x^2 \sin\left(\frac{1}{x}\right) \leq x^2$ $x \neq 0$

Let $g(x) = -x^2$, $h(x) = x^2$, and $f(x) = x^2 \sin\left(\frac{1}{x}\right)$. Since $\lim_{x \rightarrow 0} (-x^2) = 0$ and $\lim_{x \rightarrow 0} x^2 = 0$, it follows by the squeeze theorem that $\lim_{x \rightarrow 0} x^2 \sin\left(\frac{1}{x}\right) = 0$.

Here is a graph that helps to describe the situation. As you can see, the graph of $f(x)$ is always between the graphs of $g(x)$ and $h(x)$.

➡ **EXAMPLE** Suppose $4x - 3 \leq f(x) \leq x^2 + 1$ for all x near $x = 2$, except possibly at $x = 2$. Let's evaluate $\lim_{x \rightarrow 2} f(x)$.

Since $\lim_{x \rightarrow 2} (4x - 3) = 4(2) - 3 = 5$ and $\lim_{x \rightarrow 2} (x^2 + 1) = 2^2 + 1 = 5$, it follows by the squeeze theorem that $\lim_{x \rightarrow 2} f(x) = 5$.

TRY IT

Consider the fact that $\cos x \leq \frac{\sin x}{x} \leq \frac{1}{\cos x}$ near $x = 0$. Suppose you want to find $\lim_{x \rightarrow 0} \frac{\sin x}{x}$.

Evaluate this limit.

+

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

SUMMARY

In this lesson, you learned the **definition of the squeeze theorem**, which lets us find the limit of a function as x approaches a whose function values are between two other functions on both sides of a , and where the limits of the two other functions are the same as x approaches a . You learned that you can use the **squeeze theorem to evaluate limits** that are particularly difficult, with functions that have function values between two functions with known and equal limit values.
