WHAT'S COVERED

In this lesson, you will learn about mechanistic versus organic organizational structures. Specifically, this lesson will cover:

- 1. The Role of Organizational Structure
 - 1a. Formal Organization
 - 1b. Informal Organization
- 2. Formal Organizational Structure Design Considerations
- 3. Mechanistic and Organic Structures
- 4. Business Structures

1. The Role of Organizational Structure

This challenge will cover several concepts that deal with how leaders develop and shape organizations. An understanding of the concepts in this challenge is essential for leaders who need to pull people together to accomplish the essential work of a business in a consistent process over time. We will address the essential ideas.

First, an **organizational structure** is a system for accomplishing and connecting the activities that occur within an organization. People rely on structures to know what work they should do, how their work supports or relies on other employees, and how these work activities fulfill the purpose of the organization itself.

Second, **organizational design** is the process of setting up organizational structures to address the needs of an organization and account for the complexity involved in accomplishing business objectives.

Next, **organizational change** refers to the constant shifts that occur within an organizational system—for example, as people enter or leave the organization, market conditions shift, supply sources change, or adaptations are introduced in the processes for accomplishing work. Through **managed change**, leaders in an organization can intentionally shape how these shifts occur over time.

Finally, **organizational development (OD)** is the label for a field that specializes in change management. OD specialists draw on social science to guide change processes that simultaneously help a business achieve its objectives while generating well-being for employees and sustainable benefits for society. An understanding of OD practices is essential for leaders who want to maximize the potential of their organizations over a long period of time.

Together, an understanding of these concepts can help managers know how to create and direct organizations that are positioned to successfully accomplish strategic goals and objectives (Cummings et al., 2019).

To understand the role of organizational structure, consider the experience of Justin, a young manager who worked for a logistics and transportation company. His success at leading change in the United States gave his leaders the confidence that he could handle a challenging assignment: organize a new supply chain and distribution system for a company in Northern Europe. Almost overnight, Justin was responsible for hiring competent people, forming them into a coherent organization, training them, and establishing the needed infrastructure for sustained success in this new market.

If you were given this assignment, what would you do? How would you organize your employees? How would you help them understand the challenge of setting up a new organization and system? These are the kinds of questions that require an understanding of organizational structure, organizational design, organizational change, and organizational development.

One of the first issues Justin will need to address deals with how he will organize the system he will manage. The decisions about the structure of an organization are all related to the concept of organizational design. There are two fundamental forms of structure to remember when designing an organization: formal organization and informal organization.

Organizational Structure

The system of task and reporting relationships that control and motivate colleagues to achieve organizational goals.

Organizational Design

The process by which managers define organizational structure and culture so that the organization can achieve its goals.

Organizational Change

The transition that organizations experience as they move from the current state to a future state.

Managed Change

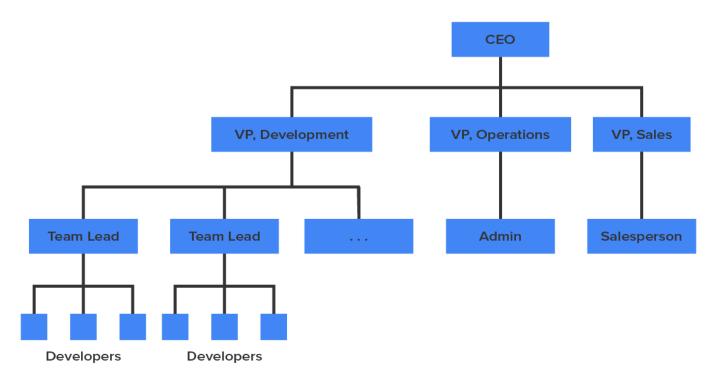

How leaders in an organization intentionally shape shifts that occur in the organization when market conditions shift, supply sources change, or adaptations are introduced in the processes for accomplishing work over time.

Organizational Development (OD)

The label for a field that specializes in change management.

1a. Formal Organization

The **formal organization** is an officially defined set of relationships, responsibilities, and connections that exist across an organization. The traditional organizational chart, as illustrated in the diagram below, is perhaps the most common way of depicting the formal organization. The typical organization has a hierarchical form with clearly defined roles and responsibilities.

When Justin sets up his formal organization, he will need to design the administrative responsibilities and communication structures that should function within an organizational system.

The formal organizational system describes how flow of information and resources should occur within an organization.

To establish the formal organization, Justin will identify the essential functions that need to be part of the system, and he will hire people to fill these functions. He will then need to help employees learn their functions and how these functions should relate to one another.

Formal Organization

A fixed set of rules of organizational procedures and structures.

1b. Informal Organization

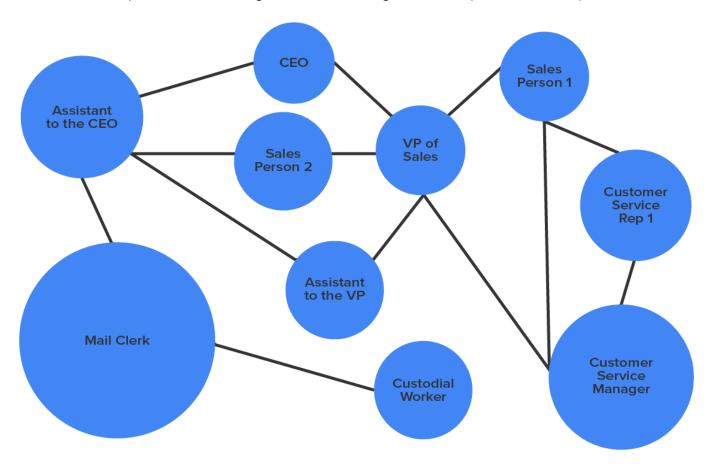

The **informal organization** is sometimes referred to as the invisible network of interpersonal relationships that shape how people actually connect with one another to carry out their activities. The informal organization is formed through the common conversations and relationships that occur naturally as people interact with one another in their day-to-day relationships. It is usually complex, impossible to control, and has the potential to significantly influence an organization's success.

As depicted in the following diagram, the informal organization can also be mapped, but it is usually very different from the formal organization.

The chart you see in this example is called a network map, because it depicts the relationships that exist between different members of a system.

Some members are more central than others, and the strength of relationships may vary between any two pairs or groups of individuals. These relationships are constantly in flux, as people interact with new individuals, current relationships evolve, and the organization itself changes over time (Katz & Kahn, 1978).

The informal organization in Justin's design will form as people begin interacting with one another to make sense of their new roles and accomplish their work. Usually, the informal organization closely mirrors the formal organization. As people learn who the key influencers are within the system, they will begin to rely on these individuals to accomplish the work of the organization. These key influencers can be different than those identified in the formal organization, which could either help or hinder the organization's overall success.

In sum, the formal organization explains how an organization *should* function, while the informal organization is how the organization *actually* functions. Formal organization will come as Justin hires and assigns people to different roles. He can influence the shape of the informal organization by giving people opportunities to build relationships as they work together. Both types of structures shape the patterns of influence, administration, and leadership that may occur through an organizational system.

As we continue our discussion of structure and design, we will next examine different ways of understanding formal structure.

Informal Organization

The connecting social structure in organizations that denotes the evolving network of interactions among its employees, unrelated to the firm's formal authority structure.

2. Formal Organizational Structure Design Considerations

Now, Justin will need to choose and implement an administrative system for delegating duties, establishing oversight, and reporting on performance. He will do this by designing a formal structure that defines the responsibilities and accountability that correspond to specific duties throughout an organizational system. In this section, we'll discuss the factors that any manager should consider when designing an organizational structure.

- 1. Bureaucracy. One of the most common frameworks for thinking about these issues is called the bureaucratic model. It was developed by Max Weber, a 19th-century sociologist. Weber's central assumption was that organizations will find efficiencies when they divide the duties of labor, allow people to specialize, and create structure for coordinating their differentiated efforts, usually within a hierarchy of responsibility. He proposed five elements of bureaucracy that serve as a foundation for determining an appropriate structure: specialization, command-and-control, span of control, centralization, and formalization (Weber, 1958).
- 2. Specialization. The degree to which people are organized into subunits according to their expertise is referred to as specialization—for example, human resources, finance, marketing, or manufacturing. It may also include specialization within those functions. For instance, people who work in a manufacturing facility may be well-versed in every part of a manufacturing process, or they may be organized into specialty units that focus on different parts of the manufacturing process, such as procurement, material preparation, assembly, quality control, and the like.
- 3. *Command-and-Control*. The next element to consider is the reporting and oversight structure of the organization. **Command-and-control** refers to the way in which people report to one another or connect to coordinate their efforts in accomplishing the work of the organization.
- 4. *Span of Control*. Another question addresses the scope of the work that any one person in the organization will be accountable for, referred to as **span of control**. For instance, top-level leaders are usually responsible for all of the work of their subordinates, mid-level leaders are responsible for a narrower set of responsibilities, and lower-level employees usually perform very specific tasks. Each manager in a hierarchy works within the span of control of another manager in the organization.
- 5. *Centralization*. The next element to consider is how to manage the flows of resources and information in an organization, or its **centralization**. A highly centralized organization concentrates resources in only one or

- very few locations, or only a few individuals are authorized to make decisions about the use of resources. In contrast, a diffuse or decentralized organization distributes resources more broadly throughout an organizational system along with the authority to make decisions about how to use those resources.
- 6. Formalization. The last element of bureaucracy, **formalization**, refers to the degree of definition in the roles that exist throughout an organization. A highly formalized system (e.g., the military) has a very defined organization, a tightly structured system, in which all of the jobs, responsibilities, and accountability structures are very clearly understood. In contrast, a loosely structured system (e.g., a small, volunteer nonprofit) relies heavily on the emergent relationships of informal organization.

Bureaucratic Model

Max Weber's model states that organizations will find efficiencies when they divide the duties of labor, allow people to specialize, and create structure for coordinating their differentiated efforts within a hierarchy of responsibility.

Specialization

The degree to which people are organized into subunits according to their expertise—for example, human resources, finance, marketing, or manufacturing.

Command-and-control

The way in which people report to one another or connect to coordinate their efforts in accomplishing the work of the organization.

Span of Control

The scope of the work that any one person in the organization will be accountable for.

Centralization

The concentration of control of an activity or organization under a single authority.

Formalization

The process of making a status formal for the practice of formal acceptance.

3. Mechanistic and Organic Structures

Using the principles of bureaucracy outlined above, managers like Justin have experimented with many different structures as a way to shape the formal organization and potentially to capture some of the advantages of the informal organization. Generally, the application of these principles leads to some combination of the two kinds of structures that can be seen as anchors on a continuum in the table below.

Elements of Organizational Structure and Their Relationship to Mechanistic and Organic Forms			
Mechanistic		Organic	
Highly formalized	Standardization	Low	

High/Narrow	Specialization	Low/Broad
Centralized	Centralization	Decentralized
Functional	Departmentalization	Divisional

On one end of the continuum is **mechanistic bureaucratic structure**. This is a strongly hierarchical form of organizing that is designed to generate a high degree of standardization and control. Mechanistic organizations are often characterized by a highly **vertical organizational structure**, or a "tall" structure, due to the presence of many levels of management. A mechanistic structure tends to dictate roles and procedures through strong routines and standard operating practices.

In contrast, an **organic bureaucratic structure** relies on the ability of people to self-organize and make decisions without much direction such that they can adapt quickly to changing circumstances. In an organic organization, it is common to see a **horizontal organizational structure**, in which many individuals across the whole system are empowered to make organizational decisions. An organization with a horizontal structure is also known as a **flat organization** because it often features only a few levels of organizational hierarchy.

The principles of bureaucracy outlined earlier can be applied in different ways, depending on the context of the organization and the managers' objectives, to create structures that have features of either mechanistic or organic structures.

EXAMPLE The degree of specialization required in an organization depends both on the complexity of the activities the organization needs to account for and on the scale of the organization.

A more organic organization may encourage employees to be both specialists and generalists so that they are more aware of opportunities for innovation within a system. A mechanistic organization may emphasize a strong degree of specialization so that essential procedures or practices are carried out with consistency and predictable precision. Thus, an organization's overall objectives drive how specialization should be viewed.

EXAMPLE An organization that produces innovation needs to be more organic, while an organization that seeks reliability needs to be more mechanistic.

Similarly, the need for a strong environment of command-and-control varies by the circumstances of each organization. An organization that has a strong command-and-control system usually requires a vertical, tall organizational administrative structure. Organizations that exist in loosely defined or ambiguous environments need to distribute decision-making authority to employees, and thus will often feature a flat organizational structure.

The span of control assigned to any specific manager is commonly used to encourage either mechanistic or organic bureaucracy. Any manager's ability to attend to responsibilities has limits; indeed, the amount of work anyone can accomplish is finite. A manager in an organic structure usually has a broad span of control, forcing him or her to rely more on subordinates to make decisions. A manager in a mechanistic structure usually has a narrow span of control so that he or she can provide more oversight. Thus, increasing span of control for a manager tends to flatten the hierarchy while narrowing span of control tends to reinforce the hierarchy.

Centralization addresses assumptions about how an organization can best achieve efficiencies in its operations. In a mechanistic structure, it is assumed that efficiencies will occur in the system if the resources and decisions flow through in a centralized way. In an organic system, it is assumed that greater efficiencies will be seen by

distributing those resources and having the resources sorted by the users of the resources. Either perspective may work, depending on the circumstances.

Finally, managers also have discretion in how tightly they choose to define the formal roles and responsibilities of individuals within an organization. Managers who want to encourage organic bureaucracy will resist the idea of tightly defining roles and responsibilities. They will encourage and empower employees to self-organize and define for themselves the roles they wish to fill. In contrast, managers who wish to encourage more mechanistic bureaucracy will use tools such as standard operating procedures (SOPs) or written policies to set expectations and exercise clear controls around those expectations for employees.

When a bureaucratic structure works well, an organization achieves an appropriate balance across all of these considerations. Employees specialize in and become highly advanced in their ability to perform specific functions while also attending to broader organizational needs. They receive sufficient guidance from managers to stay aligned with overall organizational goals. The span of control given to any one manager encourages them to provide appropriate oversight while also relying on employees to do their part. The resources and decision-making necessary to accomplish the goals of the organization are efficiently managed. There is an appropriate balance between compliance with formal policy and innovative action.

Mechanistic Bureaucratic Structure

Describes organizations characterized by (1) centralized authority, (2) formalized procedures and practices, and (3) specialized functions. They are usually resistant to change.

Vertical Organizational Structure

Organizational structures found in large mechanistic organizations; also called "tall" structures due to the presence of many levels of management.

Organic Bureaucratic Structure

Used in organizations that face unstable and dynamic environments and need to quickly adapt to change.

Horizontal Organizational Structure

Flat organizational structure in which many individuals across the whole system are empowered to make organizational decisions.

Flat Organization

A horizontal organizational structure in which many individuals across the whole system are empowered to make organizational decisions.

4. Business Structures

Aside from the considerations outlined above, organizations will often set structures according to the functional needs of the organization. A functional need refers to a feature of the organization or its environment that is

necessary for organizational success. A business structure is designed to address these organizational needs. There are two common examples of functional structures illustrated here.

Product structures exist where the business organizes its employees according to product lines or lines of business.

EXAMPLE Employees in a car company might be organized according to the model of the vehicle that they help to support or produce. Employees in a consulting firm might be organized around a particular kind of practice that they work in or support.

Where a functional structure exists, employees become highly attuned to their own line of business or their own product.

Geographic structures exist where organizations are set up to deliver a range of products within a geographic area or region. Here, the business is set up based on a territory or region. Managers of a particular unit oversee all of the operations of the business for that geographical area.

In either functional structure, the manager will oversee all the activities that correspond to that function: marketing, manufacturing, delivery, client support systems, and so forth. In some ways, a functional structure is like a smaller version of the larger organization—a smaller version of the bureaucracy that exists within the larger organization.

One common weakness of a bureaucratic structure is that people can become so focused on their own part of the organization that they fail to understand or connect with broader organizational activities. In the extreme, bureaucracy separates and alienates workers from one another. These problems can occur when different parts of an organization fail to communicate effectively with one another.

Some organizations set up a **matrix structure** to minimize the potential for these problems. A matrix structure describes an organization that has multiple reporting lines of authority.

EXAMPLE An employee who specializes in a particular product might have both a functional reporting line and a geographic reporting line. This employee has accountability in both directions. The functional responsibility has to do with his or her specialty as it correlates with the strategy of the company as a whole. However, his or her geographic accountability is to the manager who is responsible for the region or part of the organization in which he or she is currently working. The challenge is that an employee may be accountable to two or more managers, and this can create conflict if those managers are not aligned. The potential benefit, however, is that employees may be more inclined to pay attention to the needs of multiple parts of the business simultaneously.

REFLECT

- 1. What is an organizational structure?
- 2. What are different types of organizational structures?
- 3. What is organizational design?
- 4. What concepts should guide decisions about how to design structures?

For your Touchstone assignment, you will want to compare your chosen or recommended generic strategy to the organization's structure and design. As an example, let's again consider Walmart. Walmart pursues a low-cost strategy, which is evidenced by their generic stores, limited in-store amenities, and reliance on mostly part-time employees. This enables Walmart to keep their operating costs low, giving them the ability to pass everyday low prices onto customers.

Product Structures

Exist where the business organizes its employees according to product lines or lines of business.

Geographic Structures

Exist where organizations are set up to deliver a range of products within a geographic area or region.

Matrix Structure

An organizational structure that groups people by function and by product team simultaneously.

SUMMARY

In this lesson, you learned about the role of organizational structure, a system for accomplishing and connecting the activities that occur within an organization. This structure informs people within an organization regarding what work they should do, how their work supports or relies on other employees, and how these work activities fulfill the purpose of the organization itself. You learned that there are two fundamental forms of structure to keep in mind when designing an organization: formal organization, an officially defined set of relationships, responsibilities, and connections that exist across an organization, and informal organization, the invisible network of interpersonal relationships that shape how people actually connect with one another to carry out their activities. Put another way, the formal organization explains how an organization should function, while the informal organization is how the organization actually functions. Next, you explored several formal organizational structure design considerations, learning about Weber's bureaucratic model and the five elements of bureaucracy that serve as a foundation for determining an appropriate structure: specialization, command-and-control, span of control, centralization, and formalization. You learned that the application of the principles of bureaucracy leads to some combination of two kinds of structures: mechanistic structures, which are strongly hierarchical forms of organizing designed to generate a high degree of standardization and control, often characterized by a highly vertical or "tall" organizational structure, and organic structures, which are more horizontal or "flat" organizationally, in which many individuals across the whole system are empowered to make organizational decisions. Lastly, you learned about two different business structures designed to address an organization's functional needs: product structures and geographic structures.

Best of luck in your learning!
